### INTRODUCTION

A detailed coverage of the principles of stellar evolution is beyond the scope of this thesis. Moreover, for the interested reader, there are excellent textbooks (Kippenhahn et al. 2012; Clayton 1968) covering every aspect in the field of stellar astrophysics. Nevertheless, for the sake of completeness, a small introduction to several fundamental parameters, tailored to our needs, will be attempted in the next few paragraphs.

#### 1.1 Helium stars

A brief explanation of what a helium star is

#### 1.1.1 Formation of Helium stars

A small section explaining how helium stars are being formed

#### 1.1.2 Evolution of single Helium stars

A small section explaining the evolution of single helium stars

#### Mixing mechanisms

convection, overshooting, thermohaline

#### Effects of rotation

Rotational mixing

#### Transportation of angular momentum

Eddington-Sweet circulation etc

#### Winds and mass loss

#### 1.2 Evolution of binary systems

Few words about how most stars form in binary systems

#### 1.2.1 Interaction and orbital parameters

Roche lobe overflow, cases A/B/C etc

#### 1.2.2 Mass transfer

Few words about mass transfer in binary systems

#### 1.2.3 Common envelope

Explain a little bit in more detail the basics of CE

#### 1.2.4 Angular momentum transfer

Effects of angular momentum transfer

#### 1.2.5 Gravitational waves

The very basics for GWs and their impact on binary mergers

#### 1.3 Stellar transients

Couple of words for the different types of stellar transients and how can we observe them

#### 1.3.1 Classification of Supernovae

Explain in details the difference between core collapse SNe and type Ia and different subdivision

#### 1.3.2 Type Ib/c Supernovae

Explain in details this particular branch

#### 1.3.3 X-ray binaries

HMXB, LMXB, UCXB

## **METHODS**

Explain shortly what MESA is.

### 2.1 Modules for Experiments in Stellar Astrophysics

Write 2-3 pages of the MESA basics and how it works (Newton iterations etc). Consider possible subsections

### 2.2 Physical assumptions

Mention which physical assumptions we used

#### 2.2.1 Single stars

For single helium stars

### 2.2.2 Binary systems

For the binary systems

# RESULTS

Mension the mesa reader Python module for the extraction and analysis of MESA data

- 3.1 Single Helium stars
- 3.2 Neutron star + Helium star binaries

# CONCLUSIONS

Write the conclusions we arrived at for all cases and what are they implying for the formation of DNS binaries

# **DISCUSSION**

Write a page or two for your findings, future work etc

## **BIBLIOGRAPHY**

Clayton, D. 1968, Principles of Stellar Evolution and Nucleosynthesis (McGraw-Hill)
